## 1 Copper protein SOD

Superoxide dismutase (SOD) Cu–Zn active center.[14]

1a

 $\mathbf{Asp} = \mathbf{aspartate}$ 

 $\mathbf{His}\ = \mathrm{histidine}$ 

1b

Superoxide dismutases catalyze the proton-dependent dismutation of two superoxide radical anions to molecular oxygen and hydrogen peroxide.

$$2 \operatorname{O}_2^{\bullet-} + 2 \operatorname{H}^+ \xrightarrow{\operatorname{SOD}} \operatorname{O}_2 + \operatorname{H}_2 \operatorname{O}_2 \tag{1}$$

$$O_2 + e^- \xrightarrow{-0.33 \text{ V}} O_2^{\bullet-} + 2 \text{ H}^+ + e^- \xrightarrow{+0.89 \text{ V}} \text{H}_2 O_2$$
(2)

1

[8, p.76]

Table 1: Rate constants of superoxide dismutation (without SOD)

Reaction	$\mathbf{k},\mathbf{M}^{-1}\mathbf{s}^{-1}$
$O_2^{\bullet-} + O_2^{\bullet-}$	6
$O_2^{\bullet-} + HO_2^{\bullet}$	$1.5 \times 10^7$
$\mathrm{HO_2}^{ullet} + \mathrm{HO_2}^{ullet}$	$7.6  imes 10^5$
2	

#### [**4**, p.8]

Fact.  $[O_2^{\bullet}] = 10^{-11} M$  (molarity in organism). Fact.  $[SOD] = ca. \ 10^{-5} M$  (molarity in organism).

The dismutation of superoxide without catalyst is a second-order reaction, depending on the concentration of superoxide.(Table 1) Since the superoxide concentration in organisms is very low, the dismutation rate is also low. This causes damage of the DNA. Catalyst SOD is present in large excess, so the reaction kinetics is pseudo first-order.[4, p.9] The SOD-catalyzed dismutation of superoxide is the fastest enzymatic reaction and proceeds at a near diffusion-limited rate ( $k = 2 \times 10^9 \text{ M}^{-1} \text{s}^{-1}$ , 298 K).[6, p.204]

$$\label{eq:norm} \begin{array}{l} ^{1} \mbox{ NHE, pH = 7.} \\ ^{2} \mbox{ O}_{2} ^{\bullet -} \overleftarrow{\overset{H^{+}}{\longleftarrow}} \mbox{ HO}_{2} ^{\bullet} , \mbox{ pK}_{a} = 4.88 \end{array}$$

		X-ray O–O, Å
O <sub>2</sub>	Oxygen	1.21
$O_2^{\bullet -}$	Superoxide	1.33
$O_2^{2-}$	Peroxide	1.49

 $<sup>^3</sup>$  Hydrogen peroxide: O–O–H angle: 102.7±0.3°

# 2 Model Complexes

 $\mathbf{2a} = 1 \text{-pyridin-2-yl-N-[4-(pyridin-2-ylmethylideneamino)butyl]} methanimine$ 

- $\diamond \ [\mathrm{Cu}^{\mathrm{II}}\mathbf{2a}][\mathrm{ClO}_4]_2 \ [11]$
- $\diamond \ [{\rm Cu}^{\rm I} \mathbf{2a} \}_2][{\rm ClO}_4]_2 \ [11]$

#### 2.1 Spectral Properties

Complex		$\lambda,\mathrm{nm}~(\epsilon,\mathrm{M}^{\text{-1}}\mathrm{cm}^{\text{-1}})$	color
$[\mathrm{Cu}^{\mathrm{I}}\mathbf{2a}]_2{}^{2+}$	Dimer	478 (13600)	brown
$[\mathrm{Cu}^{\mathrm{I}}\mathbf{2a}]^+$	Monomer	422 (3700) / 596 (2400)	green
$[\mathrm{Cu}^{\mathrm{II}}\mathbf{2a}]^{2+}$	Monomer	710 (110)	blue

*Remark.*  $[Cu^{I}2a]_{2}^{2+}$  shows spectra independent from the solvent.  $\Rightarrow$  No participation of the solvent to the inner coordination sphere. The peak at 478 nm can be assigned to a ligand to metal charge transfer (LMCT).

*Remark.*  $[Cu^{I}2a]^{+}$  is sensitive to the solvent.  $\Rightarrow$  Participation of the solvent to the inner coordination sphere of Cu<sup>I</sup>.[11, p.3346][5, p.1706]

*Remark.*  $[Cu^{II}2a]^{2+}$  tends to become five-coordinate.[11, p.3342]

#### 2.2 Structures

blue

Figure 1:  $[Cu^{II}2a]^{2+}$ , Copper (II) Monomer, distorted square planar coordination (dihedral angle: 33.0°), *CCDC 148873* 

brown

Figure 2:  $[{\rm Cu^I2a]_2}^{2+},$  Copper (I) Dimer, tetrahedral coordination (dihedral angle: 89.6°), Cu–Cu: 5.86 Å, CCDC 148874

Remark. Double-helical architecture, self-assembly.[13]

#### 2.3 Copper(I) Dimer/Monomer equilibrium

The copper(I) complex is dimeric. The coordination geometry of the  $N_4$  donor system is tetrahedral (Figure 2). The coordination of superoxide seems to be impossible for this coordination geometry.

The dimeric copper(I) complex dissociates to two monomeric copper(I) complexes.<sup>4</sup> The monomeric copper(I) complex and the corresponding monomeric copper(II) complex are the reactive components for the dismutation. Because of the rigid structure of the ligand 2a, the monomeric copper(I) complex is probably coordinated distorted square-planar, similar to the copper(II) complex. The superoxide is able to attack.

 $<sup>^4</sup>$  An example for the structure of a related monomeric copper(I) complex is shown in [2]. The dihedral angle is 50.6°.

#### 2.4 Electron Transfer Reaction

Scheme 1: Reaction mechanism

(A) = (B)

*Remark.* Equilibrium  $K_1$  (Equation 3) is the dominant path and rate determining (slow) step in the reduction reaction. The reason is the major rearrangement of the ligand 2a.

## 2.5 SOD mimetic activity

Complex	Activity, %	Dihedral angle, $^\circ$
$[\mathrm{Cu}^{\mathrm{II}}\mathbf{2a}][\mathrm{ClO}_4]_2$	1.5	33.0
$[\mathrm{Cu}^{\mathrm{II}}\mathbf{2b}][\mathrm{ClO}_4]_2$	3.0	29.5
$[\mathrm{Cu}^{\mathrm{II}}\mathbf{2c}][\mathrm{ClO}_4]_2$	0.3	
$[\{\mathrm{Cu}^{\mathrm{I}}\mathbf{2c}\}_2][\mathrm{ClO}_4]_2$	0.3	

Table 4: Activity – Tetrahedral distortion

 $\mathbf{5}$ 

[12]

 $\mathbf{2b}$ 

2c

 $^5\,\mathrm{In}$  % of SOD activity.

*Remark.* Ligand **2b** is more rigid than **2a**. The positive mesomeric effect (+M) of the phenyl group might play a considerable role. The tetrahedral distortion of the N<sub>4</sub> system is smaller (Ligand planarity). The monomeric copper(I) complex of **2b** is probably a more redox-reactive intermediate, explaining the higher SOD mimetic activity.

*Remark.* Ligand 2c stabilizes the less redox-reactive tetrahedral coordinated dimeric copper(I) complex, because of steric reasons caused by the two methyl groups. The complex shows a lower SOD mimetic activity. Using the monomeric copper(II) or the dimeric copper(I) complex as scavenger has no influence on activity (See Table 4).

Claim. More rigid square planar monomeric copper systems with smaller  $N_4$  torsion angles should show higher SOD mimetic activity. But these systems tend to build stable higher supramolecular structures, like double-helical, triangular, and square [2x2] grid complexes.[13][15][9]

Flexibility of the ligand

Figure 3: monomer, double-helical, triangular and square [2x2] grid copper(I) complexes

**Conjecture.** Equilibrium of flexible copper(I) species in solution.

Monomer 
$$\stackrel{K_1}{\longleftarrow}$$
 Dimer  $\stackrel{K_2}{\longleftarrow}$  Trimer  $\stackrel{K_3}{\longleftarrow}$  Tetramer (4)

6

<sup>&</sup>lt;sup>6</sup> Monomer is the reactive species for the dismutation.

#### 2.6 Promising SOD mimetic complexes

◊ Copper complexes with flexible bis(bipyridine)-based or oligobipyridine ligands, that build double-helical architecture and redox-reactive monomeric N<sub>4</sub> copper(I) species in equilibrium.[13][5]

 $\diamond$  Copper complexes with Schiff base ligands, that enforce redox-reactive square planar coordination of monomer copper(I), because of geometric constraints. Type of ligand  ${\bf 2d}.^7[3][1]$ 

 $\mathbf{2d}$ 

2d = N,N'-bis(pyridine-2-ylmethylene)-(S,S)-1,2-cyclohexanediamine

 $<sup>^7</sup>$  The dihedral angle of the copper (II) complex of  $\mathbf{2d}$  is  $9.1^\circ.[3]$ 

## 3 Copper-Oxygen complexes

**Conjecture.** copper(II)-dioxygen species

- 1.  $O_2 \longrightarrow$  mononuclear copper(II)-superoxo, end on
- 2.  $O_2 \longrightarrow$  mononuclear copper(II)-superoxo, side on
- 3.  $O_2 \longrightarrow$  dinuclear copper(II)-peroxo, end on/end on
- 4.  $O_2 \longrightarrow$  dinuclear copper(II)-peroxo. side on/side on
- 5.  $O_2^{\bullet-} \longrightarrow$  mononuclear copper(II)-peroxo, end on
- 6.  $O_2^{\bullet-} \longrightarrow$  mononuclear copper(II)-peroxo, side on

**Example 1.** mononuclear copper(II)-superoxo (1.), N<sub>4</sub> donor.

 $[(TMG_3tren)Cu^{II}-O-O^{\bullet}]^+$  Schindler [16]

- 1. X-ray
  - (a) O–O distance: 1.280(3) Å
  - (b) O–O–Cu angle:  $123.53(18)^\circ$
  - (c) Color: green
- 2. UV/Vis
  - (a)  $\lambda = 442 / 690 \text{ nm}$
  - (b) copper(I) complex: »colorless«
- 3. IR, Raman
  - (a)  $\tilde{\nu}_{O-O} = 1122 \text{ cm}^{-1}$

The superoxide  $(O_2^{\bullet-})$  is coordinated *end-on*.

 $\mathbf{4} = \mathrm{Tris}(\mathrm{tetramethylguanidino})\mathrm{tren} \ (\mathrm{TMG}_3\mathrm{tren})$ 

**Example 2.** binuclear copper(II)-peroxo (3.), N<sub>4</sub> donor.

 $[[(Tris(2-pyridylmethyl)amine)Cu^{II}]_2(O_2)]^{2+}$  KARLIN [7]

1. X-ray

- (a) O–O distance: 1.432(6) Å
- (b) O–O–Cu angle: 107.7(2)°
- (c) Cu–Cu: 4.359(1) Å
- 2. UV/Vis
  - (a)  $\lambda = 530 \ (10000) \ / \ 600 sh \ (6000) \ nm$
- 3. IR, Raman
  - (a)  $\tilde{\nu}_{O-O} = 832 \ {\rm cm}^{-1}$

The peroxide  $({\rm O_2}^{2-})$  is coordinated end on/end on.

 $\mathbf{5} = \text{Tris}(2\text{-pyridylmethyl}) \text{amine (tmpa)}$ 

IUPAC 1-pyridin-2-yl-N,N-bis(pyridin-2-ylmethyl)methanamine

**Example 3.** binuclear copper(II)-peroxo (4.), N<sub>3</sub> donor.

[(HB(3,5-iPr<sub>2</sub>pz)<sub>3</sub>Cu<sup>II</sup>]<sub>2</sub>(O<sub>2</sub>) KITAJIMA [10]

 $\mathbf{iPr}\ = \mathbf{isopropyl}$ 

 $\mathbf{pz} = \mathbf{pyrazolyl}$ 

- 1. X-ray
  - (a) O–O distance: 1.412 Å
  - (b) Cu–Cu distance: 3.56 Å
- 2. UV/Vis

(a)  $\lambda = 449 (21000) / 551 (790) \text{ nm}$ 

3. IR, Raman

(a)  $\tilde{\nu}_{O-O} = 741 \text{ cm}^{-1}$ 

The peroxide  $({\rm O_2}^{2-})$  is coordinated *side on/side on*.

6 = whydrotris(pyrazolyl)borate«

*Claim.* There is no evidence for the participation of a copper(II)-oxygen complex in the mechanism of the dismutation of superoxide catalyzed by the model complex.
